In yet another embodiment, the roughened area is formed by adding material to the inner surface of the stent. For example, and not limited to, material may be added to the inner surface of the stent by sputtering or other means. As before, material may be sputtered onto the entire inner surface of the stent, or material may be  
5 sputtered onto selected portions of the inner surface of the stent.

In another embodiment, the roughened area is formed on a surface of a planar member of an appropriate material. The planar member may then be rolled into a tubular shape such that the surface having the roughened area forms an inner surface of the tubular shape, and a stent pattern cut into the tubular shape. Alternatively, the  
10 stent pattern may be cut into the planar member before or after the roughened area is formed on the surface of the planar member, and before or after the planar member is rolled into the tubular shape.

In yet a further embodiment, a protective material may be applied to an outer surface of a tubular body portion, or the surface of the planar member that will  
15 become an outer surface of the tubular shape, before the roughened area is formed to protect the outer surfaces from damage during formation of the roughened areas. The protective material may be removed before or after the stent pattern is cut.

In another embodiment, a coating may be applied to the inner surface of the stent after the roughened area is formed. This coating is selected to be bio-  
20 compatible and to provide reduced interaction between the roughened area of the stent and fluid flowing through a body lumen where the stent is implanted.

Other features and advantages of the invention will become apparent from the following detailed description, taken in conjunction with the accompanying drawings, which illustrate, by way of example, the features of the invention.
